

WHAT IS CLAIMED IS:

1. A photomask comprising:

a semitransparent phase shifting area which has a semitransparent area and a transparent area, which are respectively transparent and semitransparent with respect to exposure light beams, and in which light beams having passed through said semitransparent area is substantially 180 degrees out of phase with respect to light beams having passed through said transparent area; and

a pattern which is formed in said photomask and in which a semitransparent phase shifting pattern and a transparent pattern are arranged in a repeated pitch equal to or smaller than the critical resolution of a projection exposure optical system.

2. A photomask according to Claim 1, wherein when the repeated pitch represented by P is defined as:

$$P = \alpha \cdot \lambda / NA$$

, where NA represents a numerical aperture of a projection lens, λ represents a wavelength of the exposure light beams, and $\alpha \leq 0.8$.

3. A photomask according to Claim 1, wherein when a size ratio α of the size of said transparent pattern to the size of said semitransparent phase shifting pattern is defined as:

09188366-111098

$$\alpha = \beta \cdot \sqrt{T}$$

, where T represents the transmittance of the semitransparent phase shifting portion, and $0.5 \leq \beta \leq 2.0$.

4. A photomask according to Claim 1, wherein when the repeated pitch P is defined as:

$$P = \alpha \cdot \lambda / NA$$

, where NA represents a numerical aperture of a projection lens, λ represents a wavelength of the exposure light beams, and $\alpha \leq 0.8$, and

when a size ratio α of the size of said transparent pattern to the size of said semitransparent phase shifting pattern is defined as:

$$\alpha = \beta \cdot \sqrt{T}$$

, where T represents the transmittance of the semitransparent phase shifting portion, and $0.5 \leq \beta \leq 2.0$.

5. A photomask according to Claim 1, wherein an area, in which the light intensity, on a projection surface, of the light beams passed therethrough is one-half or lower than that, on the projection surface, of the light beams having passed through said semitransparent phase shifting area, includes a portion corresponding to an area which is double-exposed with a projected exposure surface thereof in the step and repeat exposure.

09188368 111098

6. A method of forming a pattern, comprising the steps of:

forming a photoresist film on a substrate;
placing said substrate having said photoresist film on a sample stage of an aligner;

exposing a predetermined first area of said substrate by using a photomask including a semitransparent phase shifting area which has a semitransparent area and a transparent area, which are respectively transparent and semitransparent with respect to exposure light beams, and in which light beams having passed through said semitransparent area is substantially 180 degrees out of phase with respect to light beams having passed through said transparent area, and a pattern which is formed in said photomask and in which a semitransparent phase shifting pattern and a transparent pattern are arranged in a repeated pitch equal to or smaller than the critical resolution of a projection exposure optical system;

moving horizontally said substrate; and

exposing a second area of said substrate which is adjacent to said predetermined first area by using said photomask.

7. A method according to Claim 6, wherein said pattern in which said semitransparent phase shifting pattern and said transparent pattern are arranged at a repeated pitch equal to or smaller than the critical resolution of said projection exposure optical system is

00188366-11098

arranged in at least two sides which are perpendicular to each other and are located in the periphery of a pattern element area of said substrate in said photomask.

8. A method of manufacturing a semiconductor device, comprising the steps of:

forming diffusion layers in a surface of a semiconductor substrate;

forming an insulating film on said semiconductor substrate having said diffusion layers;

forming opening portions through a photoresist film on said diffusion layers by a pattern forming method, said pattern forming method including the steps of: forming said photoresist film on said insulating film; placing said substrate having said photoresist film on a sample stage of an aligner; exposing a predetermined first area of said substrate by using a photomask including a semitransparent phase shifting area which has a semitransparent area and a transparent area, which are respectively transparent and semitransparent with respect to exposure light beams, and in which light beams having passed through said semitransparent area is substantially 180 degrees out of phase with light beams having passed through said transparent area, and a pattern which is formed in said photomask and in which a semitransparent phase shifting pattern and a transparent pattern are arranged in a repeated pitch equal to or smaller than the critical resolution

09188368 111098

of a projection exposure optical system; moving horizontally said substrate; and exposing a second area of said substrate which is adjacent to said predetermined first area by using said photomask;

etching selectively said insulating film with said photoresist film having said opening portions as a mask to expose said diffusion layers; and

forming a wiring layer, which is electrically connected to said diffusion layers, on said insulating film.

9. A method of manufacturing a semiconductor device, comprising the steps of:

forming a first insulating film on a substrate;

forming a first wiring layer on said first insulating layer;

forming a second insulating film on said substrate having said first wiring layer;

forming opening portions through a photoresist film on said first wiring layer by a pattern forming method, said pattern forming method including the steps of: forming said photoresist film on said second insulating film; placing said substrate having said photoresist film on a sample stage of an aligner; exposing a predetermined first area of said substrate by using a photomask including a semitransparent phase shifting area which has a semitransparent area and a transparent area, which are respectively transparent and

semitransparent with respect to exposure light beams, and in which light beams having passed through said semitransparent area is substantially 180 degrees out of phase with respect to light beams having passed through said transparent area, and a pattern which is formed in said photomask and in which a semitransparent phase shifting pattern and a transparent pattern are arranged in a repeated pitch equal to or smaller than the critical resolution of a projection exposure optical system; moving horizontally said substrate; and exposing a second area of said substrate which is adjacent to said predetermined first area by using said photomask;

etching selectively said second insulating film with said photoresist film having said opening portions as a mask to expose said first wiring layer; and

forming a second wiring layer, which is electrically connected to said first wiring layer, on said second insulating film.
